

Laszlo Theory: Core Axiom

Laszlo's Law of Evolutionary Feedback

Any intelligent species capable of altering or selecting its environment inherently triggers a closed loop of evolution.

This axiom formalizes the idea that the moment a species begins choosing its habitat - whether consciously (e.g., migrating to Mars) or structurally (e.g., building domes, cities, or underwater colonies) - it stops being a passive subject of evolution and becomes its own evolutionary architect.

The feedback loop is not hypothetical; it is **self-proving**. Each choice of environment becomes a new selective pressure, which modifies the species, who then further adapts or re-engineers their surroundings, tightening the loop.

Laszlo's Loop, therefore, is more than a model - it is a recursive law governing any species that achieves technological agency over its habitat.
